

USD 40M bounded research program

Juri Janovski / HALVETH proposes a staged collaboration with xAI or another expressly authorized Musk-affiliated entity. This document opens a discussion; it is not an invoice, entitlement claim, sale, assignment, or transaction authorization.

PROGRAM CEILING USD 40,000,000	FIRST STEP 30-minute exploratory call	INITIAL ACCESS One bounded evaluation capsule
--	---	---

Parties	Juri Janovski / HALVETH and a verified, duly authorized xAI or Musk-affiliated legal entity.
Program	Staged research, validation, software, security, provenance, and human-AI collaboration.
Initial capsule	One selected demonstrator with purpose, declared scope, provenance, test conditions, evaluation criteria, and known limitations.
Evaluation license	Confidential evaluation only; non-exclusive, non-transferable, non-sublicensable; no production use, commercial exploitation, model training, reverse engineering beyond the agreed evaluation, or derivative distribution without a later written agreement.
Rights retained	HALVETH/Juri retains the complete corpus, unprovided source material, unpublished research, unprovided know-how, future work, names, marks, and every right not expressly granted in a signed agreement.
Existing public code	Licenses already attached to public components remain unchanged. This proposal neither revokes nor expands them.
New work	Ownership, licensing, publication, attribution, commercialization, maintenance, and revenue participation are negotiated per milestone before work begins.
Funding	The USD 40M figure is a ceiling for the complete staged program. Payment schedule, deliverables, acceptance tests, currency or token, valuation, tax, termination, and escrow terms require a definitive contract.
Confidentiality	Mutual, purpose-limited, need-to-know, and subject to lawful disclosure. No duty to make false statements or suppress independently held evidence.
Public statements	Only by mutual written approval, with accurate attribution and no implied endorsement.

Proposed staged path

1 Evaluate Agree one question and test one bounded capsule.	2 Validate Reproduce material behavior and document gaps, risks, and useful capability.	3 Develop Build selected modules against written milestones and acceptance tests.	4 Deploy / license Negotiate production rights and economics only for validated components.
